

SUSTAINABILITY RESOURCE

Sustainability Information

ORYA's approach is practical rather than purely promotional: make better material choices, reduce unnecessary waste, keep useful resources in circulation where feasible, and verify claims.

Our sustainability lens

 Design out unnecessary waste Begin with the application and avoid unnecessary material, packaging or complexity.	 Keep value in use Where the system allows, prioritise reuse, refill, repair, recycling or other suitable recovery pathways.
 Use bio-based resources responsibly Agricultural residues and renewable fibres can be valuable inputs when sourced and processed appropriately.	 Evidence before claims Environmental and product claims should be supported by relevant product-specific documentation.

Four operational segments

- **Sustainable Packaging:** practical alternatives to conventional plastic where the application and end-of-life pathway make sense.
- **Natural & Traditional Food:** responsible sourcing and appropriate packaging without unsupported health or environmental claims.
- **Sustainable Hydration:** reuse/refill and fit-for-purpose formats where they can genuinely reduce packaging or material burden.
- **Agro-Waste Products:** exploration of agricultural residues and bio-based fibres as useful inputs for products and materials.

Recyclable, biodegradable and compostable are not interchangeable

 Recyclable A product/material may be recyclable where an appropriate collection and processing system exists.	 Biodegradable Biological breakdown can occur under suitable conditions; time and environment matter.
--	---

Compostable

Designed to break down under defined composting conditions; an applicable standard/certification should support the specific claim.

Circularity and agro-waste

The Ellen MacArthur Foundation describes circular economy through three design-led principles: eliminate waste and pollution, circulate products and materials, and regenerate nature. ORYA uses these principles as a reference for thinking about products, packaging and value chains; they are not a claim that every ORYA product is circular.

FAO highlights residues valorisation as a route for turning processing by-products and other residues into useful value, including new bioproducts. This supports ORYA's inclusion of Agro-Waste Products as an operational segment while keeping each product subject to technical and supply validation.

Responsible communication

ORYA will not use a natural, plant-based, biodegradable, compostable or recycled-material description as automatic proof of lower environmental impact. Product-specific evidence and the relevant use/end-of-life context matter.

Reference framework: Ellen MacArthur Foundation • FAO • UNEP. These sources inform principles only and do not certify or endorse ORYA products.
